## Lab Work \#1

## Some experiments with acids and bases

pH meter

## Calibrate the pH meter

## I. Aqueous acidic solutions

## Warning Acid

Experiment \#1 : how can we prove that ethanoic acid reacts with water?

Water (about 30 mL )

$$
\mathrm{pH}=
$$

Water (about 30 mL ) and few drops of pure ethanoic acid

$$
\mathrm{pH}=
$$

$\qquad$

Explain why these measurements prove that a chemical reaction occurred.

## Course

By definition : $\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$, or $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=10^{-\mathrm{pH}}$

- Calculate the concentration of oxonium ions $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right.$] before and after you add ethanoic acid.
- The reaction between ethanoic acid and water is immediate (or instantaneous); its equation is:
$\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{l})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})$
Explain why this equation accords with your experimental results.

## Experiment \#2 : reaction between ethanoic acid and water

An aqueous solution of ethanoic acid (concentration: $C=1,0 \times 10^{-2} \mathrm{~mol}^{-1} \mathrm{~L}^{-1}$ ) It was prepared by dissolving pure ethanoic acid into water

20 mL of the solution of ethanoic acid
$\mathrm{pH}=$
Keep this beaker for part II experiments

## limiting reactant

| Equation | $\mathrm{CH}_{3} \mathrm{COOH}(1)$ | $+\mathrm{H}_{2} \mathrm{O}(1)$ | $\stackrel{\rightharpoonup}{\square}$ | $\mathrm{CH}_{3} \mathrm{COO}^{-}(\mathrm{aq})$ | $+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Quantities (in mol) |  |  |  |  |
| Initial ( $\mathrm{x}=0$ ) | C.V | excess |  |  |  |
| During the reaction |  |  |  |  |  |
| At the maximum extent $\left(x=x_{\text {mxx }}\right)$ |  | excess |  |  |  |
| At the real final extent $\left(x=x_{i}\right)$ |  | excess |  |  |  |

Compare $x_{f}$ et $x_{\text {max }}$. Is the reaction between ethanoic acid and water complete (total) or limited?

## Experiment \#3 : reaction between hydrogen chloride and water

An aqueous solution of hydrochloric acid (concentration:C $=1,0 \times 10^{-2}$ mol.L-1);
it was prepared by dissolving hydrogen chloride $(\mathrm{HCl})$ into water.

20 mL of the solution of hydrochloric acid

$$
\mathrm{pH}=
$$

$\qquad$

## limiting reactant

| Equation | $\mathrm{HCl}(g)$ |  |  |  |  | $+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | $\square$ | $\mathrm{Cl}^{-}(\mathrm{aq})$ | $+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Quantities (in mol) |  |  |  |  |  |  |  |  |
| Initial ( $\mathrm{x}=0)$ | $\mathrm{C} . \mathrm{V}$ | excess |  |  |  |  |  |  |  |
| During the <br> reaction |  |  |  |  |  |  |  |  |  |
| At the maximum <br> extent $\left(\mathrm{x}=\mathrm{x}_{\text {max }}\right)$ |  | excess |  |  |  |  |  |  |  |
| At the real final <br> extent $\left(\mathrm{x}=\mathrm{x}_{\mathrm{t}}\right)$ |  | excess |  |  |  |  |  |  |  |

Compare $\mathrm{x}_{\mathrm{f}}$ et $\mathrm{x}_{\text {max }}$. Is the reaction between HCl and water complete (total) or limited?

Course (conclusion of exp\#2 and 3)
$\mathrm{HCl}(\mathrm{g})$ is a "strong acid":
it means that its reaction with water is
So : $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$................ C
$\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{I})$ in a "weak acid".
it means that its reaction with water is
So : $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right] \ldots . . . . . . . . . . . . ~ C ~$

## II. Chemical equilibrium

## Course

As the reaction between ethanoic acid and water is limited, the chemical system reaches an equilibrium state.

In the final state, all the reactants and products of the reaction exist together.

$$
\mathrm{CH}_{3} \mathrm{COOH}(I)+\mathrm{H}_{2} \mathrm{O}(I) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(a q)
$$

## Beaker \#1

Carefully, add few drops of pure ethanoic acid
pH = $\qquad$

## Beaker \#2

Add half a spatula of
$\mathrm{pH}=$

20 mL of the solution of ethanoic acid
ethanoate ion $\left(\mathrm{CH}_{3} \mathrm{COO}^{-}\right)$,
mix to dissolve

## Course

The chemical equilibrium can be moved:

- If we add a reactant, the equilibrium is moved to the right.
- If we add a product, it is moved to the left.

## III. Thermic effect of a reaction between an acid and a base

## Beaker \#1

20 mL of the solution of hydrochloric acid C = 1,0 mol/L

Temperature : T =

mot
20 mithe solution of
hyorochioric acid $C=1,0$

## Beaker \#2

20 mL of the solution of sodium hydroxide (base) $\mathrm{C}=1,0 \mathrm{~mol} / \mathrm{L}$

Carefully, pour beaker 1 into beaker 2 ; and measure the temperature.

Is the reaction endothermic, athermic or exothermic ?

Which experiment could we do to show the effect of the concentration on the increase of temperature?

## Lab Work \#1

Some experiments with acids and bases
pH meter

Calibrate the pH meter

Explain why these measurements prove that a chemical reaction occurred.

## Course

By definition : $\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$, or $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=10^{-\mathrm{pH}}$

- Calculate the concentration of oxonium ions $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$before and after you add ethanoic acid.
- The reaction between ethanoic acid and water is immediate (or instantaneous); its equation is:
$\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{I})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}(\mathrm{aq})+\mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})$
Explain why this equation accords with your experimental results.
